[Resqski Ski Finder](#)

Launched at the end of the 12/13 season Resqski is a device for finding skis in deep snow up to 30 metres away & up to a metre depth. And it really works!

Simply stick or screw them on your prized planks & never worry about losing a ski in powder again. Check out: <https://vimeo.com/55388514>

Resqski works using RF (radio frequency) technology & should not interfere with the operation of avalanche transceivers. Avalanche transceivers operate at 457 KHZ whereas Resqski operates at frequency 2.45 GHZ. A credit card sized handheld receiver communicates with specially developed homing tags that lead you to the lost ski using flashing lights & audible beeps. The lights move from red to green & the beeps get ever louder & more frequent the closer you get to the ski.

Each receiver has four numbered buttons (1, 2, 3 & 4) allowing for a total of four homing tags to be registered to the receiver. You'd therefore register your first pair of skis to buttons 1 & 2.

The bases are designed so that the homing tags can be removed from the base plate. A pair of dummy homing tags are supplied to be installed in the base plate to protect it when the homing tags have been removed & to give a clean streamlined appearance when the Resqui system is not needed.

Additional pairs of base plates & dummy homing tags can be purchased to allow the transfer of the homing tags to other pair of skis.

An additional pair of homing tags (including base plates & dummy homing tags) can be purchased & registered to buttons 3 & 4 on the receiver thus allowing one receiver to search for two pairs of skis (ie, four individual skis).

The receiver is powered by a single replaceable CR2032 battery.

The two replaceable LR54 batteries in each of the homing tags give a season of operating power if turned on/off daily or 12-15 weeks of power if left on permanently. And the battery status can be easily identified at any time thanks to the red LED light when turned on.

Resqski Ski Finder System
£88.00 (including 20 % tax)
